Autopilot Detection

Check Enrollment Status of Windows Devices
Before Processing for Seamless Asset Disposition

- Autopilot & Intune Enrollment Detection
- USB, Custom ISO & Network Boot Deployment
- Re-Check Any Device by Serial Number
- Offline Checking for Sites Without Internet

For Windows Devices

Checks Autopilot and Intune enrollment status

Deploy by USB drive, custom ISO or Ziperase Command Center network boot.
Every result saved in the Ziperase Customer Portal.

Enrollment Detection

- Checks each Windows device against Microsoft's APIs before processing
- Returns Autopilot and Intune enrollment status as Enrolled or Not Enrolled
- Reads the hardware hash, serial number, vendor and model

Deployment Options

- Runs from a USB drive or network boot
- Works with custom ISO deployments
- Runs automatically on every network boot through [Ziperase Command Center](#)

Online & Offline Checking

- Devices with internet access send results straight to the Ziperase Customer Portal
- Network-booted devices connect through Ziperase Command Center
- Offline mode saves a file to the USB drive for import into the portal later

Enrollment Records

- Every result saved against the serial number in the Ziperase Customer Portal
- Records searched by serial number and filtered by enrollment status
- Records exported for audits

Re-Check Status

- Any device re-checked from the portal by serial number, with no reprocessing
- Each update runs a fresh live check against Microsoft's APIs
- Check history kept for each record, with timestamps

Where It Fits in Your Process

- Checks enrollment status only, with erasure as a separate step
- Not Enrolled devices go on to [Ziperase USB Erase](#) or [Ziperase Command Center](#)
- The organization that enrolled a device removes it from Autopilot or Intune

Key Benefits

- Enrolled devices identified before work starts, so each unit is processed once
- Devices confirmed as unenrolled ahead of dispatch, so they stay with the buyer
- Technician hours go to devices that can be sold
